Surface scanning

State-of-the-art laser-assisted scanning technology is used to scan and digitize all kinds of different models from nature or even existing concrete blocks. A unique model number is defined in advance for your surface design. The surface data can be adjusted and changed to your wishes using state-of-the-art CAD programs, so that you receive your individual and unique product. Stackability, removal of trip hazards and creation of drainage outlets are only a few of our machining standards for the surface modeling of your concrete block products.

Thanks to minimal milling radii, we are able to make our molds replicate nature in a detailed and intricate way.
